

# Parkeon Delivers Secure Payment Solutions With Seeker

## Company Overview

Parkeon is a global leader in parking management and ticketing solutions for public transport. Parkeon solutions are designed to make concrete improvements to the daily life of millions of urban dwellers and are contributing to the development of new smart cities.

*“Seeker answered our integrations and automation needs. It provides training and knowledge to its users. Seeker is the perfect tool to help us improve our security practice to build excellent software.”*

—L. Porchon, CISO of Managed Business Service division, Parkeon

## Business overview and challenge

Parkeon is a key player in the urban mobility sector and a global provider of parking and transport management solutions. Parkeon offers a unique range of parking control and payment services in 55 countries and more than 3,000 cities around the world.

Parkeon develops real-time payment systems suitable for all sales channels—credit and debit cards, mobile phone accounts, prepaid cards, e-purse schemes, and contact/contactless card technology. These solutions are deployed on Parkeon’s own point-of-sale (POS) terminals, such as curbside parking meters or “pay and display” and “pay on foot” car parks.

The rapid growth of e-commerce and remote (POS) security breaches led Parkeon to increase the security of their applications to the highest possible level, regardless of the deployment’s geographical location.

Parkeon’s IT department chose Seeker, our interactive application security testing (IAST) tool, to validate end-to-end security and PCI (Payment Card Industry) compliance of their main electronic ticketing and transaction product, ArchiPEL. Seeker was chosen due to its unique combination of accurate vulnerability detection, PCI compliance capabilities, integration into development processes, and ease of use for developers and testers without security expertise.

## Solution evaluation

Parkeon builds complete payment solutions that centralize electronic payment flows on behalf of their clients. Both activities require overall solution architecture compliance to standards and norms in the industry such as PCI DSS (Payment Card Industry Data Security Standard).

Parkeon had been using a dynamic application security testing (DAST) tool to validate the security of applications in their integration environment, but the solution was not working as they had hoped.

The application is developed using agile development methods and is updated in production five times per quarter. Parkeon needed a tool that integrates security validation into existing automated processes and is easy to operate by developers and testers who are not security experts.

## Deployment and benefits realized

While using Seeker, Parkeon has identified three key benefits.

First, Seeker understands and verifies how data flows through the application, ensuring that the entire system, end to end, complies with security standards such as PCI DSS. It also identifies vulnerabilities in relation to their impact on sensitive data.

## Business benefits

### Seeker ensures that the entire system, end to end, complies with security standards at each release

By focusing on data, Seeker provides testing for critical data requirements such as those defined in PCI DSS Section 6.

### Seeker facilitates communication between test and development teams

Every vulnerability is automatically linked to the offending source code, with relevant remediation suggestions.

### Seeker improves awareness and training for secure coding practices

By teaching developers how to fix problems in their own code, Seeker allows them to learn secure coding practices.

Seeker provides testing that helps meet PCI DSS Section 6 requirements. By automatically tracking critical data, such as credit card information, through various components of the payment chain, Seeker verifies that there are no vulnerabilities, such as forgotten debug data, insecure manipulation, insecure storage—even temporarily—in a file or database, insecure transmission to third parties, and so on, that may compromise it. With Seeker, Parkeon can automatically ensure that the overall system complies with security standards at each release.

Second, Seeker facilitates communication between test and development teams by pinpointing vulnerabilities back to the source code. Unlike other dynamic testing tools, which report vulnerabilities by the offending URL, Seeker automatically ties vulnerabilities back to the source code to identify where the fix must be applied. It reduces false positives to near zero, pinpoints the vulnerable source code, and provides developers with clear remediation advice tailored to the tested application.

Using Seeker, Parkeon improved security, reduced the amount of time spent on security testing, and improved communication between security and R&D:

- Developers focus their time on proven vulnerabilities and source code corrections recommended by Seeker.
- Testers gain a clear view of the application's risk posture in relation to the OWASP Top 10 criteria and Parkeon's corporate security standard.

Third, Seeker improves security awareness and trains developers to exercise secure coding practices as outlined by the OWASP Top 10. By explaining business risks and providing detailed contextual remediation suggestions, Seeker has helped Parkeon's test and development teams acquire awareness and training in an ongoing manner, thus improving the security of their code.

## Conclusion

Seeker fits seamlessly into Parkeon's security automation process, ensuring that their development and testing teams deliver frequent, secure, and compliant releases to production, while improving productivity and security awareness.

## The Synopsys difference

Synopsys helps development teams build secure, high-quality software, minimizing risks while maximizing speed and productivity. Synopsys, a recognized leader in application security, provides static analysis, software composition analysis, and dynamic analysis solutions that enable teams to quickly find and fix vulnerabilities and defects in proprietary code, open source components, and application behavior.

For more information about the Synopsys Software Integrity Group, visit us online at [www.synopsys.com/software](http://www.synopsys.com/software).
